DETAILED ACTION

Election/Restrictions

Restriction to one of the following inventions is required under 35 U.S.C. 121:

- I. Claims 1-9, drawn to a gaming system and central server which communicate the accumulated play time and allowable play time to only allow a user of a game system to play until a certain number or time period have expired, classified in class 463, subclass 42.
- II. Claims 10-18, drawn to a networked computer system with a machine and a central server, where the identification of each machine and the central server are identified and the machine is operated based on the identification parameters, classified in class 726, subclass 3.
- III. Claims 19-25, drawn to a networked computer system including computing machines and a central server, where access information is provided based on a table to change the configuration settings of the machine in order to participate in the service offered by the central server, classified in class 709, subclass 225.

The inventions are distinct, each from the other because of the following reasons:

Inventions I, II, and III are related as combination and subcombination. Inventions in this relationship are distinct if it can be shown that (1) the combination as claimed does not require the particulars of the subcombination as claimed for patentability, and (2) that the subcombination has utility by itself or in other combinations (MPEP §

Art Unit: 3713

806.05(c)). In the instant case, the combination as claimed does not require the particulars of the subcombination as claimed because only invention I by itself is related to a gaming machine where the game on the gaming machine will only run for the amount of time appropriated by the purchase of the player and allowable by the central server. Invention II and III are by themselves capable of being used on any networked computer system. In the instant case, the subcombination of invention II has separate utility such as a banking network server, where the location and the identity of the banking machine would present a need for different services by the central server. Further, the subcombination of invention II can be used for security purposes in any networked computing environment such that the identification of each machine will determine if access to the services is proper. Invention III is also capable of being used within any networked computer system where the user of the computer system is capable of using more than one application of the networked computing system. Such a service can be provided by any website on the internet that comprises a plurality of services where the user transmits a request to the central server for access to a particular application and the central server receives the request and responds with access information for the computer of the user.
